

REPLAYSERVICE™ FOR THOMSON REUTERS ENTERPRISE PLATFORM

PROVIDING A CLEAR VIEW INTO THE BENEFITS OF THOMSON REUTERS ELEKTRON REAL TIME

Thomson Reuters Elektron Real Time is our next generation, global, consolidated, low latency feed. It presents clients with a potentially significant source of competitive advantage – unrivalled breadth and depth of content at market leading latency, seamless forward and backward integration enhanced with analytics, services and capabilities for tomorrow's financial markets.

As you upgrade from the RDF network to Elektron Real Time, improve your precision in comparing data between the two environments, identifying the differences in the data and testing your applications with ReplayService™ for Thomson Reuters Enterprise Platform.

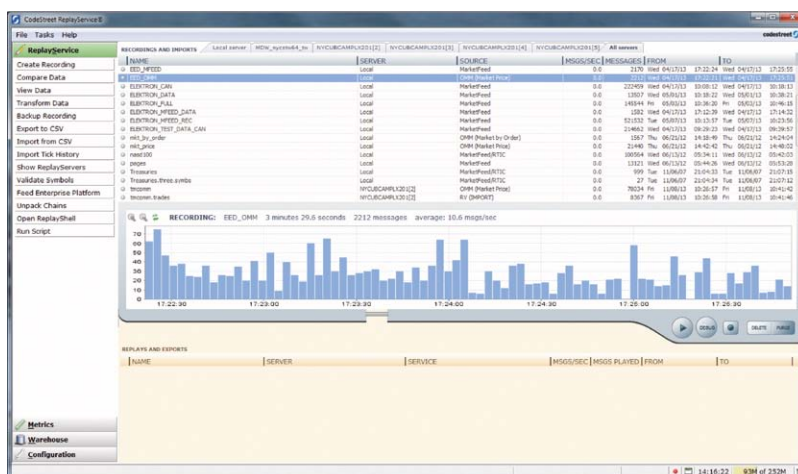

COMPARE RDF AND ELEKTRON REAL TIME DATA:

- Capture the data from both RDF and Elektron Edge
- Specify the time range over which to compare and the symbols to compare
- Select the fields you want to include/exclude from the comparison
- Insert rules and acceptable deltas for fields where you want to accept something other than an exact match
- Review the differences in fields, data values and formats
- Show the differences visually on the screen, or in a delta/difference report. The recording and replaying of data, along with generating the delta difference report can be automated and performed on a scheduled basis

Gain greater efficiency in setting up market data comparisons with just a few mouse-clicks. No hardware or additional software is required; even users without a background in market data can have market data comparisons running on their desktops within seconds. ReplayService™ for Thomson Reuters Enterprise Platform can compare both updates and snapshots in OMM and Marketfeed formats coming from RDF and Elektron Real Time.

COMPARISON TYPES:

- Both snapshots and tick-by-tick updates can be compared over a defined period
- Perform real-time snapshot comparisons
